Conservation Planning & Biodiversity Support Potential

Instructor: John Fay

I. Conservation Planning

Conservation Planning

Systematic conservation planning

C. R. Margules* & R. L. Pressey†

*CSIRO Wildlife and Ecology, Tropical Forest Research Centre, and the Rainforest Cooperative Research Centre, PO Box 780, Atherton, Queensland 4883, Australia

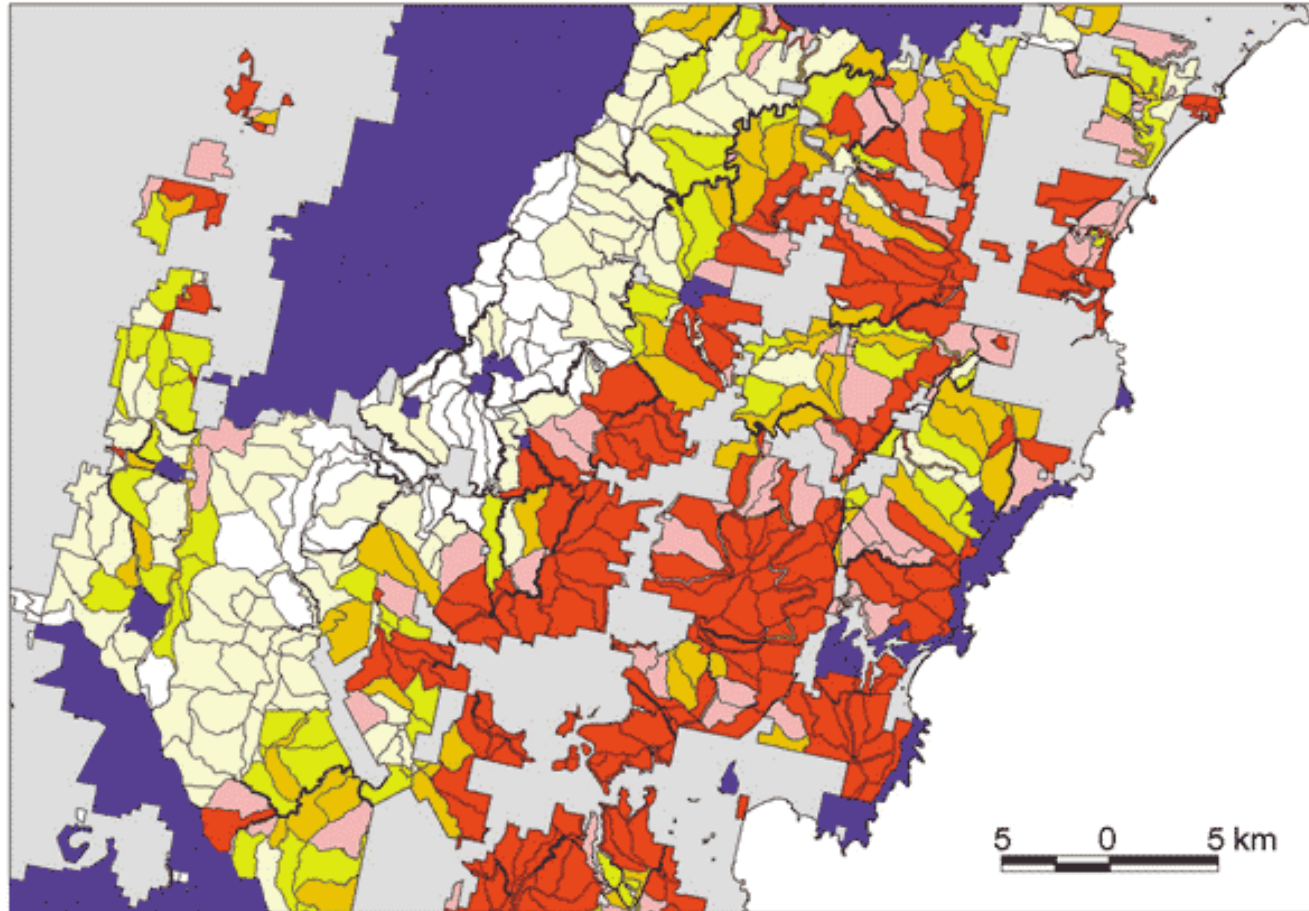

†NSW National Parks and Wildlife Service, PO Box 402, Armidale, New South Wales 2350, Australia

The realization of conservation goals requires strategies for managing whole landscapes including areas allocated to both production and protection. Reserves alone are not adequate for nature conservation but they are the cornerstone on which regional strategies are built. Reserves have two main roles. They should sample or represent the biodiversity of each region and they should separate this biodiversity from processes that threaten its persistence. Existing reserve systems throughout the world contain a biased sample of biodiversity, usually that of remote places and other areas that are unsuitable for commercial activities. A more systematic approach to locating and designing reserves has been evolving and this approach will need to be implemented if a large proportion of today's biodiversity is to exist in a future of increasing numbers of people and their demands on natural resources.

Systematic Conservation Planning

1. Measure and map biodiversity *This lecture...*
 2. Identify conservation goals for the planning region
 3. Review existing reserves
 4. Select additional reserves
 5. Implement conservation actions on the ground
 6. Manage and monitor reserves *Change detection*
- } *Optimization*
Prioritization

Conservation Planning Units

Land tenure areas in Papua New Guinea ranked by conservation potential

[*Nature* 405, 243-253 \(11 May 2000\)](#)

Conservation Planning Units

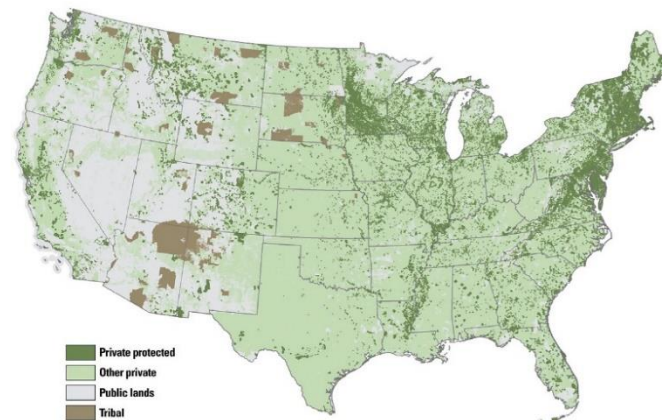

How do we parse a landscape into planning units?

Conservation Planning Units

How do we parse a landscape into planning units?

- Political (counties, townships, etc.)
- Land tenure (timber blocks, parcels)
- Tessellated shapes (blocks/hexagons)
- Natural features (HUCs, roadless areas)
- Arbitrary (protected areas)

Measuring Biodiversity: Endemism

Are there patches that contain species found nowhere else?

In how many patches does a species exist?

Measuring Biodiversity: Analysis

- Analysis begins with a list of the species occurring within each planning unit

Attributes of Occurrences			
	P.U.	Species Code	# occurrences
	1	34	1
	1	36	10
	1	67	13
	2	36	78
	2	67	137
	2	76	31
	2	34	147
	2	71	2
	2	51	79
	2	64	1
	3	67	121
	3	36	89

PU #2 has an abundance of **137** individuals of Spp. #67

Measuring Biodiversity: Analysis

- **Richness** = # rows for each planning unit

Attributes of Occurrences			
	P.U.	Species Code	# occurrences
	1	34	1
	1	36	10
	1	67	13
	2	36	78
	2	67	137
	2	76	31
	2	34	147
	2	71	2
	2	51	79
	2	64	1
	3	67	121
	3	36	89

7 different species are observed within PU #2

Measuring Biodiversity: Analysis

- **Shannon Index** = $-\sum [p_i * \ln(p_i)]$

Attributes of Occurrences			
P.U.	Species Code	# occurrences	
1	34	1	
1	36	10	
1	67	13	
2	36	78	
2	67	137	
2	76	31	
2	34	147	
2	71	2	
2	51	79	
2	64	1	
3	67	121	
3	36	89	

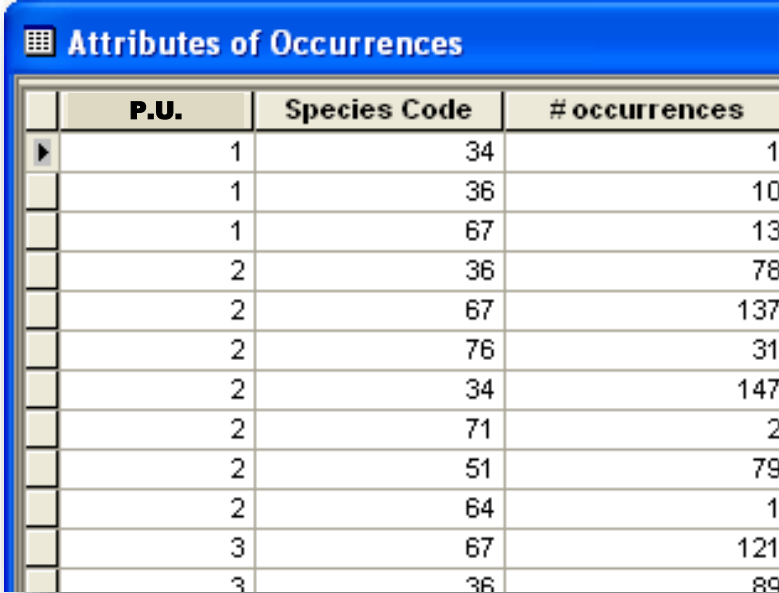

N	P	p * ln(P)
78	16.4%	-0.297
137	28.8%	-0.359
31	6.5%	-0.178
147	30.9%	-0.363
2	0.4%	-0.023
79	16.6%	-0.298
1	0.2%	-0.013
475		-1.531

PU #2 has a
Shannon Index
of 1.531

Measuring Biodiversity: Analysis

So how do we get this table??

A screenshot of a table titled "Attributes of Occurrences". The table has three columns: "P.U.", "Species Code", and "# occurrences". The data is as follows:

	P.U.	Species Code	# occurrences
▶	1	34	1
	1	36	10
	1	67	13
	2	36	78
	2	67	137
	2	76	31
	2	34	147
	2	71	2
	2	51	79
	2	64	1
	3	67	121
	3	36	89

Spatially combine species occurrence data with our HUC 12 planning units...

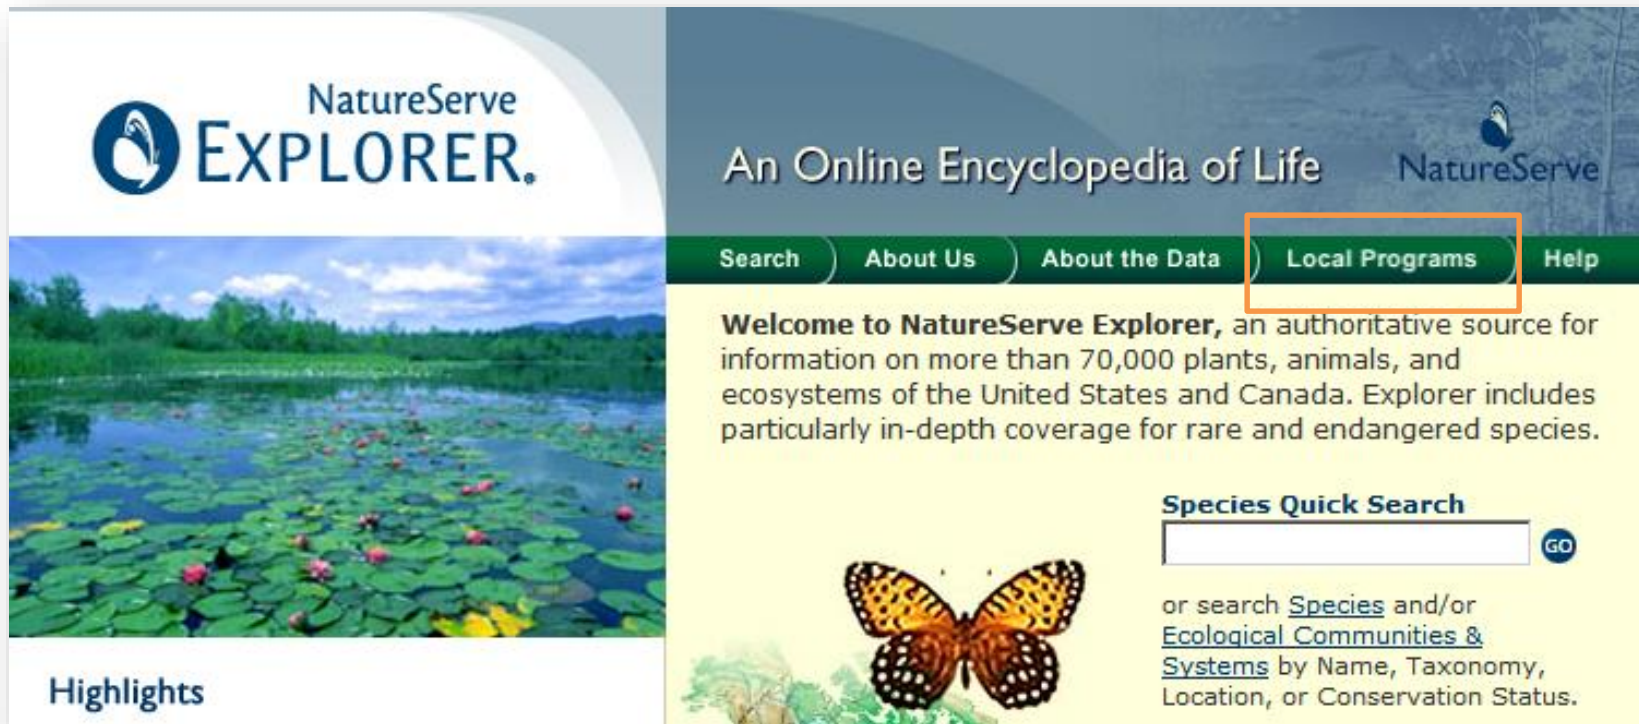

IV. Finding Data to Estimate Biodiversity

Species Occurrence Data – A Challenge

Arizona's Natural Heritage Program: Heritage Data Management System (HDMS)

The HDMS is part of a global network of more than 80 Natural Heritage Programs and Conservation Data Centres. HDMS information is available so Arizonans can make prudent decisions weighing future development, economic growth, and environmental integrity.

It identifies elements of concern in Arizona and consolidates information about their status and distribution throughout the state.

NHEO data

- Estimated Representational Accuracy

Value	Definition
Very High (>95%)	Greater than 95% of the polygon is occupied by the element.
High (80%-95%)	Between 80% and 95% of the polygon is occupied by the element.
Medium (20%-80%)	Between 20% and 80% of the polygon is occupied by the element.
Low (5%-20%)	Between 5% and 20% of the polygon is occupied by the element.
Very Low (<5%)	Less than 5% of the polygon is occupied by the element.
Unknown	Percentage of the polygon occupied by the element is unknown.
(Blank)	An estimated representational accuracy has not been assigned.

NHEO data

- EO Status

Value	Definition
Extant	The occurrence is known to still exist.
Historic	The occurrence is old or recent surveys failed to find it, but there is no evidence it is destroyed.
Destroyed	The occurrence is known to be destroyed.
Unranked	The rank of the occurrence has not been assigned.

NHEO data

- Category

Value	Definition
Vertebrate Animal	Includes mammals, birds, reptiles, amphibians, and fishes.
Invertebrate Animal	Includes mollusks, arachnids, crustaceans, and insects.
Vascular Plant	Includes dicots, monocots, gymnosperms, ferns, and fern allies.
Nonvascular Plant	Includes mosses, liverworts, hornworts, and lichens.
Natural Community	A distinct and reoccurring assemblage of populations of plants, animals, bacteria, and fungi naturally associated with each other and their physical environment.
Animal Assemblage	A concentration of animal species using the same site for a phase of their life cycle (feeding, reproduction, migration, hibernating, etc) e.g. bird colonies, bat or reptile hibernacula, concentrations of migrating shorebirds, multispecific spawning grounds, or multispecific mussel habitats.

GAP Species Distribution Models

<http://gapanalysis.usgs.gov/species/data/>

The screenshot shows the USGS National Gap Analysis Program (GAP) Species Data Portal. The header features the USGS logo with the tagline "science for a changing world". Below the logo is the title "National Gap Analysis Program (GAP) | Species Data Portal". A navigation menu includes links for "GAP HOME", "SPECIES HOME", "VISION", "VIEWER", "DATA >>" (highlighted), "RESOURCES", "NEWS", and "CONTACTS". A secondary menu below includes "DOWNLOAD", "METADATA", "STANDARDS", "STATISTICS", "HISTORY", "WEB SERVICES", and "ADDITIONAL DATA". The main content area is titled "Species Data and Modeling" and contains a paragraph describing the program's goal to build species range maps and distribution models for over 2,000 species. A list of three links is provided at the bottom: "Download Species Data >>", "Access web map services for completed species ranges and distributions >>", and "Metadata for species data >>".

Species Data and Modeling

GAP is delineating species range and predicted distribution maps for more than 2,000 species that occur within the continental US as well as Alaska, Hawaii, Puerto Rico, and the U.S. Virgin Islands (we will make these maps and datasets available as they are completed). Our goal is to build species range maps and distribution models with the best available data for assessing conservation status, conservation planning, and research (e.g., climate change impacts).

Species Occurrence Data – A Challenge

Natural Heritage Element Occurrences (NHEO) data / Biodiversity Information Serving Our Nation (BISON)

Best bet, but...

- Limited access
- Spatially/temporally biased & incomplete

Global Biodiversity Information Facility (GBIF) records

More accessible than NHEO data, but...

- Spatially/temporally biased & incomplete
- Limited precision

GAP Species Distribution Models

- Cumbersome
- Imperfect/incomplete

Newer Datasets

- TNC Resilient and Connected Landscapes
<https://toolkit.climate.gov/tool/resilient-and-connected-landscapes>
- NatureServe's Map of Biodiversity Importance
<https://www.natureserve.org/conservation-tools/projects/map-biodiversity-importance>
- Wilderness Society's Hotspot Maps

V. Creating Data to
Estimate Biodiversity

Species Occurrence Data – Surrogates

GAP Land Cover Maps

- Combine spectral reflectance (land cover) & land form (terrain) to obtain classes that reflect different habitat types

If the diversity of habitats is a reasonable surrogate for species diversity...

Then, we can aim for patches with high GAP cover richness and evenness...

Table of Contents

Surrogate Data: "Zip Codes"

ASSESSING THE BIODIVERSITY SUPPORT POTENTIAL OF FOREST PATCHES FOR CONSERVATION PLANNING

by

Jesse Emerson Leddick
Dr. Dean Urban, Advisor
December 2008

Biodiversity Surrogates or Proxies

Logic:
 Use biophysical variables
 known or suspected to
 correlate with biodiversity

elevation ↑
 ↓

FIG. 19. (Vegetation of Great Smoky Mountains, pattern of Eastern Forest System.)

cove ← → ridge

Biodiversity Surrogates or Proxies

For plants:

- temperature
- soil moisture
- soil fertility (chemistry)

For animals:

- habitat or land cover types
- temperature and moisture (via vegetation)

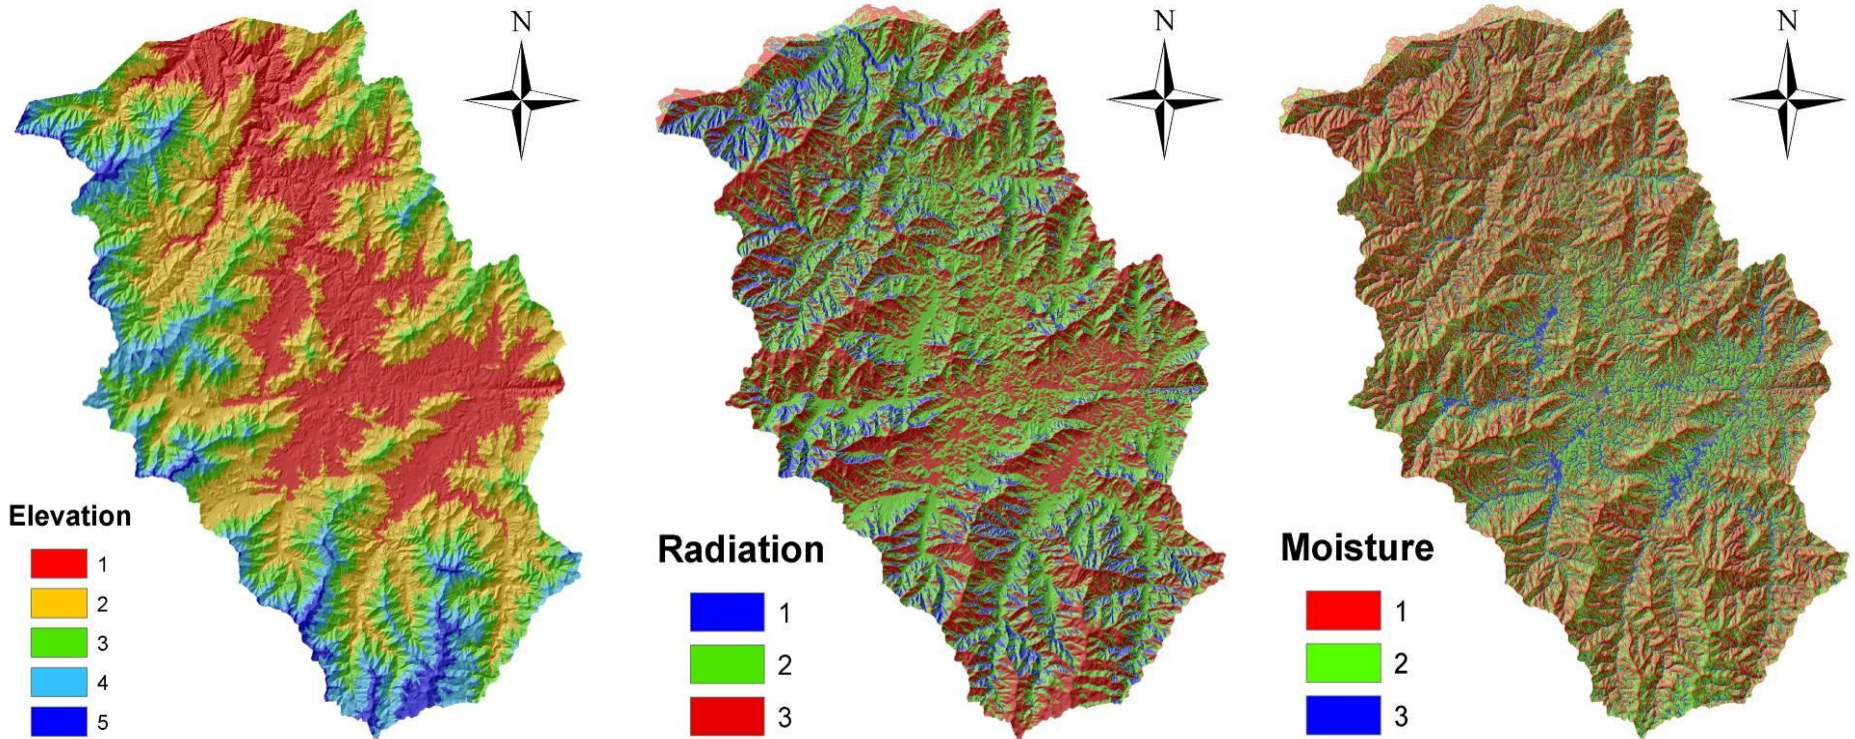

Biodiversity Surrogates or Proxies

Constructing surrogates as biophysical settings:

- Partition proxies into a few relevant levels
 - Elevation zones to reflect **temperature**
 - High (bright)/medium/low (dark) **radiation load**
 - High (wet)/medium/low (dry) **convergence**
- Calibration to actual field data would be nice...
 - Elevation zones to capture known vegetation ecotones, ...

Zipcodes: Illustration

Environmental Proxies, Western NC

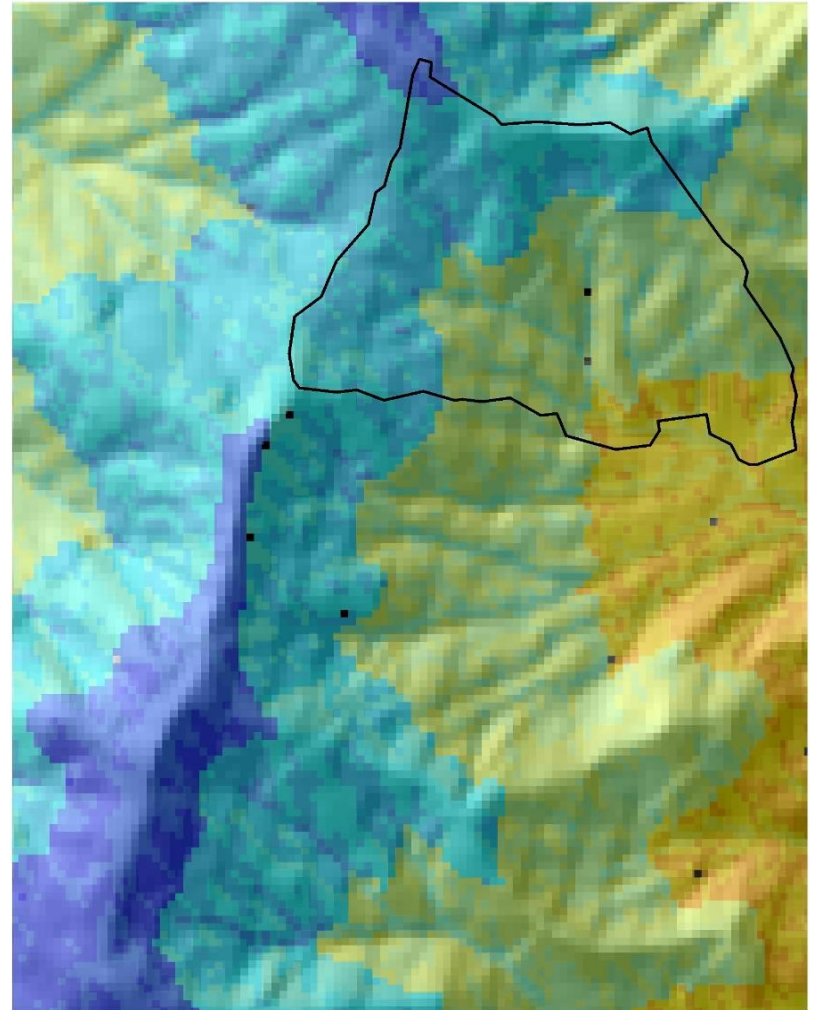

Pigeon Watershed – Jesse Leddick (MEM, 2008)

Zipcodes: Illustration

Zipcodes

Inset

Biodiversity Surrogates or Proxies

Biophysical settings:

- Combine levels of proxies ...
 - 100 * Elevation band
 - + 10 * Radiation load level
 - + Topographic convergence level

= a 3-digit “environmental zipcode”
- E.g., 531 = high elevation, bright, dry
213 = lower elevation, shaded, wet

Or... use the Combine tool

How to partition layers

- Elevation → Elevation classes -- **Quantiles**

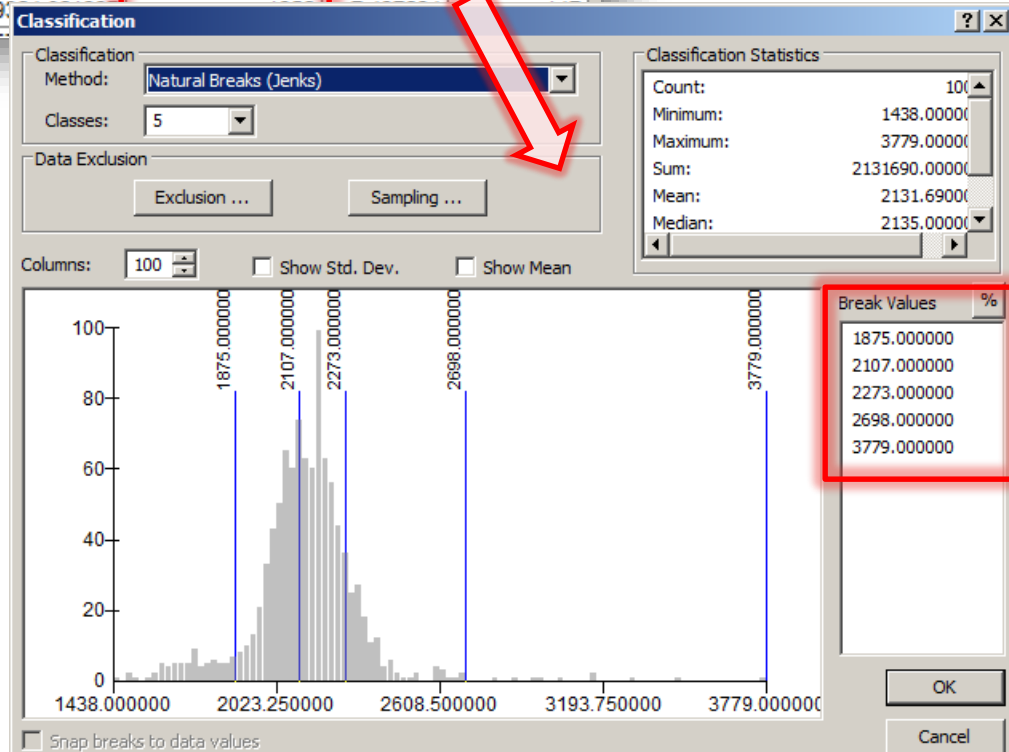

How to partition layers

- Elevation → Elevation classes: **Calibrated w/EOs**

x	y	elevation90m	tci	solarexp
528036.276208	3803169.892862	2120	30	132

452612.791	3809			

Use Natural Breaks (Jenks) on values sampled at EO locations to find natural breaks in elevation, TCI, solar datasets

Zip Codes: Temperature (Elevation)

Adiabatic lapse rates correlates elevation with temperature...

Elevation

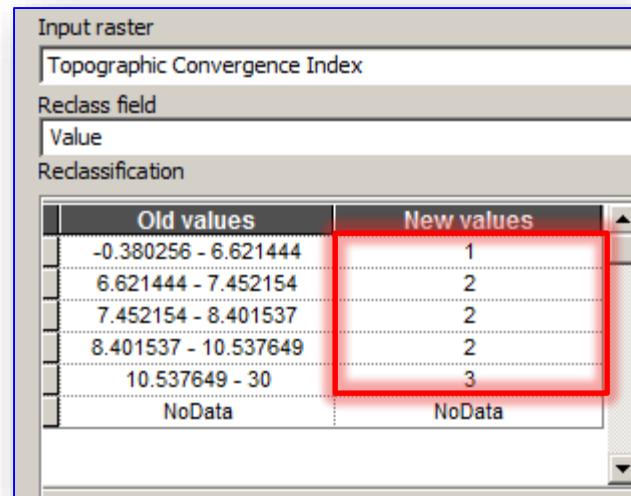

Temperature Classes (5)

Break
elevation
range into
quintiles

How to partition layers: TCI & Solar Exp.

- Break into 5 quantiles
- Recode 2nd, 3rd, and 4th quantile to the same value

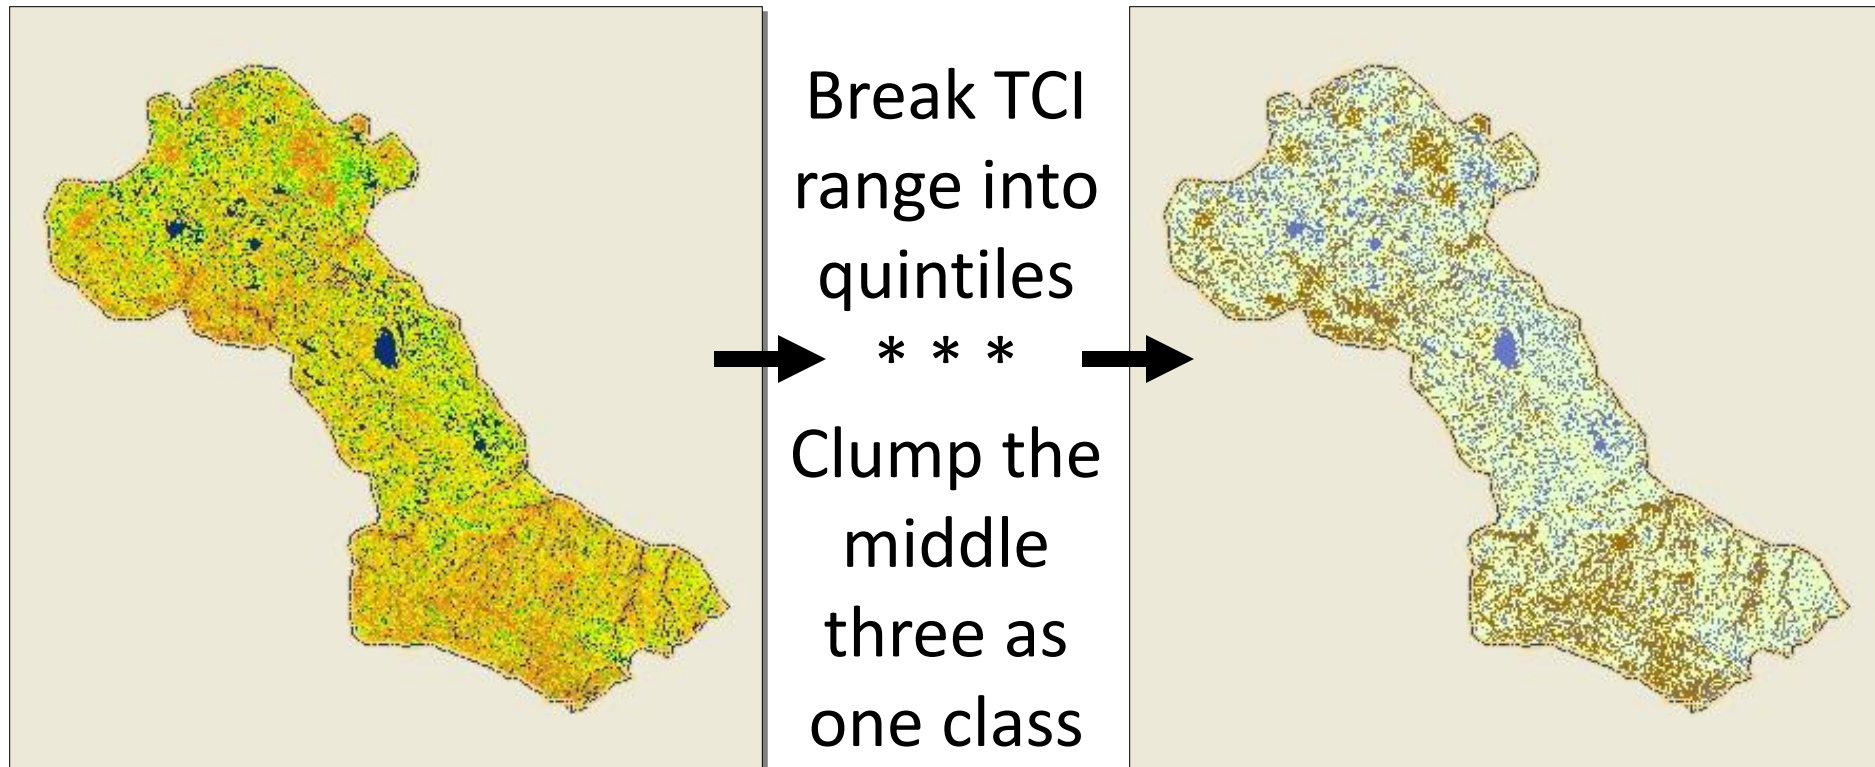

Old values	New values
-0.380256 - 6.621444	1
6.621444 - 7.452154	2
7.452154 - 8.401537	2
8.401537 - 10.537649	2
10.537649 - 30	3
NoData	NoData

- Doing so focuses zip code breaks on extremes (lowest and highest 20% of range)

Zip Codes: Moisture (Soils or TCI)

In the absence of soil moisture data, TCI can be used.

- Lowest 20% of values → **wet**;
- Highest 20% → **dry**;
- Everything else → **moderate**.

Zip Codes: Light (Solar Exposure)

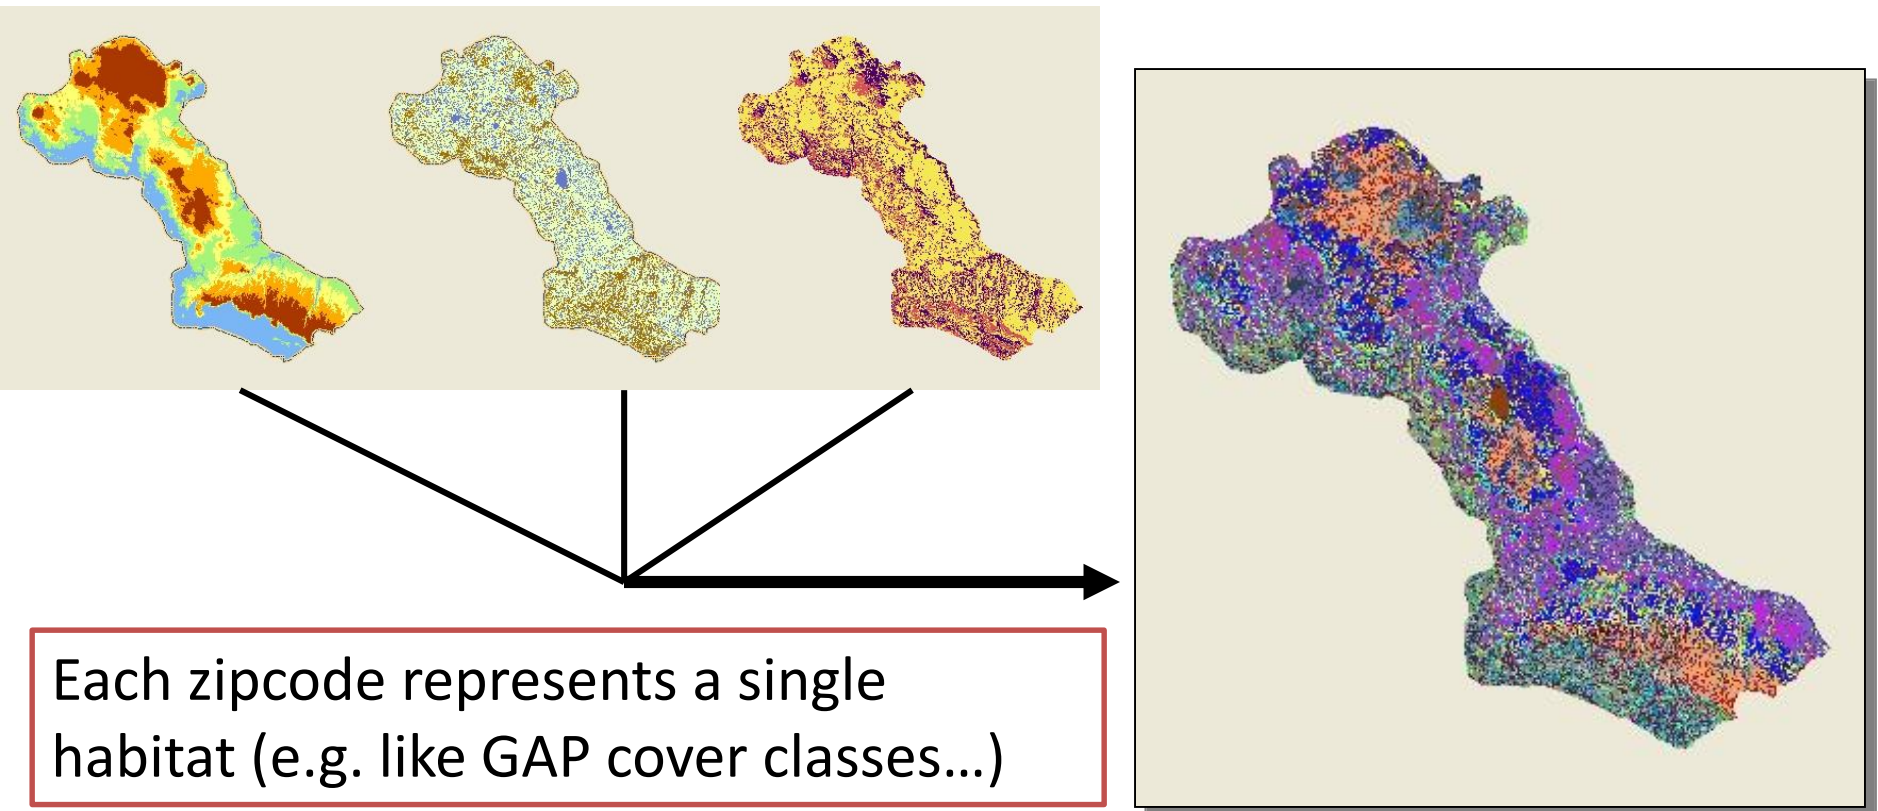

Modified hillshade method is used to calculate exposure:

- Lowest 20% of values → cool slopes;
- Highest 20% → hot slopes;
- Everything else → moderate.

Biophysical ZipCodes

The three classified maps are combined, producing a map containing classes for each unique combination of elevation class, TCI class, and solar exposure class.

Biodiversity Surrogates or Proxies

Summary:

- Zipcodes represent ecologically relevant environmental settings (habitat types)
- The factors and levels can be ...
 - calibrated to the study area (in AZ, by ecoregion, etc.)
 - expanded to include additional factors (soils, etc.)

Biodiversity Surrogates or Proxies

Applications:

- Biophysical settings \sim potential diversity
 - *Assumes that different species occur in different zipcodes*
- Biophysical diversity provides *buffering capacity* under environmental variability (allows for local movement to track climate)

Biodiversity Surrogates or Proxies

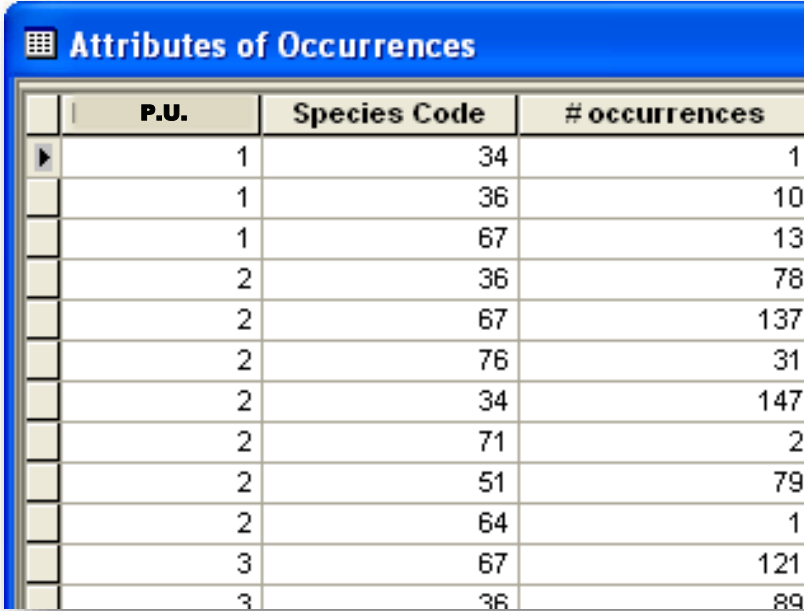

Applications:

- Zipcodes also can be calibrated to known biodiversity to yield a weighted index
 - Associate Element Occurrences with zipcode for that location
 - Compute EO density per zipcode
 - Use these densities as weights → effective “value” of each zipcode

V. Lab Exercise

Measuring Biodiversity: *Lab Exercise*

So how do we get this table??

A screenshot of a table titled "Attributes of Occurrences". The table has three columns: "P.U.", "Species Code", and "# occurrences". The data is as follows:

	P.U.	Species Code	# occurrences
▶	1	34	1
	1	36	10
	1	67	13
	2	36	78
	2	67	137
	2	76	31
	2	34	147
	2	71	2
	2	51	79
	2	64	1
	3	67	121
	3	36	89

Spatially combine species occurrence data with our Mogollon Plateau planning units (HUC12s)...

Richness & Evenness Maps

Richness

Evenness

Calculating Endemism

Calculate frequency of *az_landcover* values across *HUC_GAP* values

Rowid	AZ_LANDCOVER	FREQUENCY	SUM_COUNT
1	2	5	604
2	5	28	463
3	9	51	4567
4	11	1	6
5	12	7	3998
6	14	2	648
7	22	47	10641
8	24	4	191
9	26	16	2590
10	28	6	804
11	30	101	16394

Land cover #11 (*North American Warm Desert Active and Stabilized Dune*) is found in **only 1** HUC.

Land cover #30 (*Colorado Plateau Pinyon-Juniper Shrubland*) is found in 101 (of 142) different HUCs.

Calculating Endemism

Normalize the number of patches in which a species is observed by the total number of patches

Rowid	AZ_LANDCOVER	FREQUENCY	SUM_COUNT	Endemism
1	2	5	604	96
2	5	28	463	80
3	9	51	4567	64
4	11	1	6	99
5	12	7	3998	95
6	14	2	648	98
7	22	47	10641	66
8	24	4	191	97
9	26	16	2590	88
10	28	6	804	95
11	30	101	16394	28
12	32	98	6615	30
13	33	81	45737	42
14	34	142	696196	0
15	36	135	81682	4

Land cover #2 = 96
→ Highly endemic!

Land cover #34 = 0
→ Ubiquitous

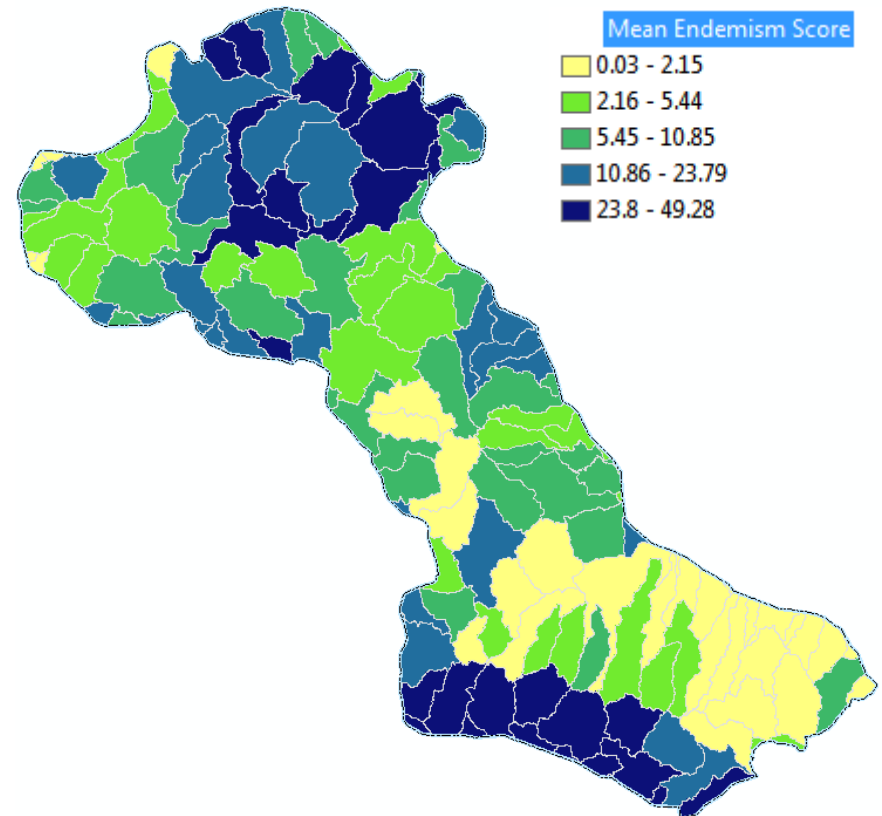

Calculating Endemism

Calculate mean endemic score for each habitat patch...

What are we neglecting in this approach?

How might we fix it?

Assignment

- Calculate HUC12 biodiversity metrics
 - Richness & Evenness of GAP cover types
- Create biophysical zip-codes for the Mogollon
 - Elevation/TCI/Solar exposure
- Calculate HUC12 biodiversity metrics again...
 - Richness & Evenness of zip-codes

See lab for deliverables...
